

The deposit is located 32 km to the West of Korosten of Zhito-
mit region and 25 km from railway station in the non-arable lands.

Granites of Proterozoic age are fine-grained, leptite-like
rocks of pink and light brownish-pink color covered with Quarte-
nary sands, thickness of which ranges from 0.7 to 2.3 m.

Physical-mechanical properties of granites:

- compression strength — 230 - 300 MPa;
- abrasion — 0.1 g/cm³;
- low-temperature resistance — 50 cycles;
- output of standard blocks — 30%;
- open thickness — 30 m.

Indicated reserves total 1.3 million cubic metres.

Waster of block output can serve as high-quality crushed
stone.

Low level of radioactivity enables to use granite in all types of
building.

Excellent decorative properties, huge reserves, market
demand guarantee a success of Joint Venture.
