

The deposit is located 35 km to the North-East from Novgorod-Volhynsky of Zhitomir region, 4 km from the railway station; motorway network is well developed. The deposit occupies non-arable lands with continuous outcrops of Proterozoic granites.

Granites are average-grained pink and pinkish-red (highly decorative) and porphyrous grey (low-decorative): polishing is of good quality, so they are suitable for facing of constructions.

Physical-chemical properties:

- compression strength — 220-234 MPa for pink rock and 161-178 MPa for the grey one;
- abrasion — 0.10 and 0.15 g/cm² accordingly;
- low temperature resistance — 50 cycles;
- output of standard blocks — 30%.

Blocks of more than 10 m³ volume for paper-producing machines can be obtained too.

Open thickness totals 32 m.

Indicated reserves amount to 1.26 mln. m³.

Low level of radioactivity enables to use granite in all types of building.

Overburden is absent.

High decorative properties, large reserves, favourable geographic conditions, easy way of development and market demand guarantee the success of Joint Venture.
